

“Education is the most powerful weapon which you can use to change the world”

My interest in Science and Technology has developed since I was in 11th grade, since then I was doing small experiments/projects and this motivated me to take Computer Science Engineering. Right after my graduation, I was offered a job in Accenture as a Network Operation Analyst which played a very important role in my life where I gained new knowledge, skills and motivated me to pursue ‘the next step’ or be held responsible for ‘the next big thing’, to do is to learn new technology and influenced me to do Masters in Artificial Intelligence as this is the Emerging Technology and using this technology for society would create a huge impact to people and also to Country’s Economic Growth.

I was a First-Class student in my undergraduate and from my 2nd year of engineering, I managed to sit with my seniors and look at what type of models /projects they used to do. This influenced me to do a project so we had made a group of 5 people and developed an app called CERTILOG V2.7(an app where the student's attendance is maintained/DataBase) where we had Bagged as the Best Mini Project which induced me to implement some good, flexible and innovative models /projects to the society which will be helpful for them, so I came up with two projects "Freyr Drone"-A Pesticide spraying drone an agriculture Approach and "Head Movement" Controlled system to Assist the physically handicapped people. With the help of these two projects, I had attended many Projects Competitions, Published Papers and also learnt how to work as a team which boost’s creativity, productivity, engagement and communication. All this is also a reason that has driven me to learn and explore New Technology "Artificial Intelligence" using this technology, I would like to make Project's/Model for the Society under the guidance of my professors.

And also, South Korea has a high reputation for R&D, Technological Innovation, ranked second in the Bloomberg Index of Most Innovative Nations 2020 and preparing to become an AI powerhouse. And we have thousands of international students from across the world flock to the country's renowned universities, many Diversities, Different culture and interacting with one other Sync's Ideas which improves Efficiency and Output. Woosong University has all the above Qualities, also Professors are supporting and guiding the students in research and development.

As I have already stated that I am Interested to pursue my Master’s in Artificial Intelligence, before I take up Master’s my Short-term goal (i.e from the application period to the date of joining in university) is to focus on programming languages that are used in Artificial Intelligence. Doing subject related Certifications and want to attend few Workshops, Seminar’s to be familiar with the course that I am opting for. And it would be really exciting if I could get in touch with my Seniors from my University to know more about the department. After I get into my University, I want to apply the theory and the Algorithms that I am learning on the daily basis in the Lab’s Practically to learn Still better and it would be a good way of understanding the subjects and the Concepts. I want to focus more on Deep Learning, Computer Vision as this is my area of interest and would like to Present Papers, do some research and would like to do Mini Projects with my class people under the guidance of the Respective department Professors. After completion of my Master’s, I hope to be able to utilize my skills and experience in the field of Artificial Intelligence for large Corporations and work for them. Last but not least I am grateful that I got the opportunity to apply to Woosong University and I will be Achieving my Goals and I will have a chance to learn and explore more about Korean Culture, Language and History. I am quite excited and looking forward to doing things together as a Team.
